Industrial Contract-Tickets confer a right to travel solely by the Industrial Train and by no higher class than that for which they are issued. If a holder chooses to travel by another train in a higher class than he contracts for, he must pay the ordinary fare as if his Industrial Ticket had no existence.

The term "Industrial Train" is confined strictly to that ordinary Passenger train which is due first to arrive from the country each week day morning at Port Louis, and to that ordinary Passenger Train which is notified to leave Port last at night.

SECOND AND THIRD CLASS MONTHLY CONTRACT TICKETS.

Available for travelling by ordinary or Industrial Trains between Port Louis and the following Stations.

What is the Source of the Water Supply; the Quality of the Water; and the Amount of Water available for each Patient every day?

Supplied in iron pipes.

1o. Plaines Wilhems Canal; quality indifferent; supply irregular during the dry season; made use of for watering and cleaning purposes.

2o. Mare-aux-Vacoas; quality generally good; made use of for drinking, cooking and bathing purposes; quality inferior during the dry season, has to be boiled and filtered. The quality of the water has greatly improved of late.

What is the number of:

I. Lavatories? Eleven.

II. Baths? Three shower baths, 4 hip baths, 6 large open and 2 slate baths.

III. Latrines? Twenty three Latrines containing 51 tubs.

What is the system of Sewerage?

No Sewers exist in this Establishment for the removal of excreta, such removal being effected by means of the dry earth system. The tubs are collected every day by Prison labour and the service is on the whole regularly and satisfactorily performed. Rain water and that from the Bath room and wash house is carried off by surface drains and underground pipes to the vegetable gardens to be utilized for watering purposes. A new underground drain with glazed earthenware pipes was constructed during the year by the Surveyor General's Department to carry off the waste water from the kitchen, bathrooms and latrines of the two Infirmaries to the back gardens. It is received into a covered collecting tank and used for watering purposes. It is desirable that all the waste water of the Establishment be received into such covered collecting tanks in order to prevent the formation of pools in back gardens and their serving as suitable breeding grounds for the anopheles mosquitoes.

RESULTS

OF

METEOROLOGICAL OBSERVATIONS

TAKEN DURING THE YEAR 1901

AT THE

ROYAL ALFRED OBSERVATORY,

MAURITIUS.

Digitized by Google

INTRODUCTION.

The Observatory is about 3 miles from the west coast and stands on a plain which is 179 feet above the sea-level. From W. S. W., through West to North, there is an uninterrupted view of the sea, and from North, through East to S. E., the ground generally slopes from the Piton, the summit of which bears about four miles E. b. S. and is 917 feet above the sea-level. Between S. E. and S. W., there is a chain of mountains, the highest peak of which, the Peterboth, bears nearly six miles due South, and has an altitude of 2,685 feet above the sea. The nearest extremeties of two spurs which run N. and N. W. from the Peterboth, are at distances of three to four miles, and have an elevation of about 560 feet.

The Island is of volcanic origin, and the rocks are more or less magnetic. Around the Observatory the soil has a depth of 3 to 14 feet, below which is solid basalt.

The Standard Barometer (Newman, No. 128) has no error, and the cistern is 180.86 feet above the sea-level. No correction has been applied for the influence of gravity on the barometrical readings. For a pressure of 30.000 inches, the correction for the latitude of the Observatory is —0.060 inch. The values given are corrected for temperature and capilarity, and reduced to sea-level.

For the pressure of the atmosphere the mean of the 9h. and 15h. observations gives approximately the mean for the day.

The thermometers are placed in a lofty room within a few feet of two large open windows, one facing the East and the other the South so that the bulbs which are from 5 to 6 feet above the ground, are generally in a current of air. The mean of the 6h. and 15h. observations gives approximately the mean temperature for the day.

All the thermometers have been verified at the Kew Observatory. They have been frequently compared with the Observatory Standards, and when necessary, corrections have been applied for their respective errors.

The minimum thermometers have been read daily at 9 hours, and the maximum at 15 hours.

The values of the Vapour Tension and Relative Humidity have been computed from Glaisher's Hygrometrical Tables, eighth edition.

The Direction and Velocity of the Wind are recorded by a self-registering Kew anemometer by Casella, the cups of which are 51.2 feet above the surface of the ground.

For the Force of the Wind the following scale has been used.

Miles per hour.	Force.	Miles per hour.	Force.
From 0 to 3...	= 0	From 35 to 40...	= 7
„ 4 „ 8...	= 1	„ 41 „ 48...	= 8
„ 9 „ 13...	= 2	„ 49 „ 56...	= 9
„ 14 „ 18...	= 3	„ 57 „ 65...	= 10
„ 19 „ 23...	= 4	„ 66 „ 75...	= 11
„ 24 „ 28...	= 5	„ 76 „ 90...	= 12
„ 29 „ 34...	= 6		

A clear day is considered to be one on which the mean amount of cloud is below 7.

The rim of Glaisher's raingauge is 8 inches in diameter, and 10 inches above the surface of the ground. The rainfall is measured at 9h., and the amount is set down to the day on which it is measured.

In the column headed "Remarks" the abbreviations are those adopted by the Meteorological Office, London.

The hours refer to Mauritius Civil Time.
